                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of identifying oligopeptide ligands to a protein by scanning synthetic combinatorial peptide libraries (SCPL). The SCPL comprise sets of hexamers which contain either one of 6 predetermined amino acids at one predetermined position in the hexamer and each set may have one predetermined amino acid at 1 of 6 predetermined pos. in the hexamer. The method is useful for identifying biologically active sequences of e.g. pharmacetical use. The peptides esp. inhibit the binding of e.g. an antibody to its antigen, a ligand to the receptor, etc.

The peptides Aw008720-25 are N-terminally acylated and C-terminally amidated peptides, isolated from a SCPL, which inhibit trysin. This peptide inhibited trysin with an IC50 of 133 micromole.
                                                                                                                                                                                                                                                                                           Ligand; synthetic combinatorial peptide library; hexamer; antibody; untigen; receptor; inhibitor; trypsin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying oligopeptide ligands for an acceptor - b synthetic peptide combinatorial libraries comprising self-solubilising, unsupported mixed oligopeptide(s)

peptide(s) with high physiological activity

```
The invention relates to a method of identifying oligopeptide ligands to a protein by scanning synthetic combinatorial peptide libraries (SCPL). The SCPL comprise sets of hexamers which contain either one of 6 predetermined amino acids at one predetermined position in the hexamer and each set may have one predetermined amino acid at 1 of 6 predetermined pos. in the hexamer. The method is useful for identifying biologically active sequences of e.g. pharmaceutical use. The peptides esp. inhibit the binding of e.g. an antibody to its antigen, a ligand to

The peptides AAW09720-25 are N-terminally acylated and C-terminally amidated peptides, isolated from a SCPV, which inhibit trysin. This peptide inhibited trysin with an ICSO of 164 micromole.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying oligopeptide ligands for an acceptor - b synthetic peptide combinatorial libraries comprising self-solublising, unsupported mixed oligopeptide(s)

The peptides are then processed using a genetic algorithm computer program which: (i) exchanges one or more amino acid residues between pairs of peptides (crossover) and/or (ii) substitutes amino acid residues in a peptide for different ones (mutation) (preferably with a mutation frequency of about 3% of the total number of residues). The altered peptides are synthesised and the screening cycle is repeated until peptides are synthesised and the screening cycle is repeated. Peptides with the desired level of activity are generated. Peptides will a high activity (e.g. as enzyme inhibitors) can be used to produce compositions for use in the drug, foodstuff and other industries.

The L2/HNK1 epitope is predominantly expressed on glycolipids and glycoproteins from nervous tissue. Peptides that mimic the L2/HNK1 epitope were isolated by screening phage peptide display libraries with antibodies to L2/HNK1. The present sequence is the consensus sequence for mimic peptides selected by HNK1 antibody. The peptides may be used for treating Alzheimer's disease or dementia. They may also be used for treating apoptosis, necrosis, Parkinson's disease with antibody and the selection of the second contraction of the secon
The present invention relates to L2/HNK1 carbohydrate epitope mimic peptides. The L2/HNK1 epitope is predominantly expressed on glycolight and glycoproteins from nervous tissue. Peptides that mimic the L2/HN epitope were isolated by screening phage peptide display libraries we antibodies to L2/HNK1. The present sequence is the homologous region between consensus sequences of mimic peptides isolated by different

Sequences AAH84132-AAH84370 represent human nucleic acid sequences which protect against cell death (1.e., apoptosis or necrosis). Sequences AAH84132, AAH84170, AAH84270, AAH84210, AAH84210, AAH84255, AAH84255, AAH84251, AAH84255, AAH84255, AAH84315 and AAH84367 represent 10 full-length cDNA clones, while the remaining nucleic acid sequences within the range given above represent the open reading frames (ORFS) of these cDNA clones. Sequences AAG98810-AAG98829 represent the polypeptides encoded by the cell death
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      benign tumour; anaemia; gastrointestinal disorder; gastritis; ulcerative colitis; liver disease; biliary cirrhosis; kidney disorder glomerulonephritis; cystitis; endometricosis; endocrine disorder; Grave's disease; Hashimoto's thyroiditis; skin condition; dermatitis; urticaria; immune disorder; acquired immunodeficiency syndrome; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cell death protective; apoptosis; necrosis; human; drug screening; cell death-associated disorder; central nervous system disorder; psychiatric disorder; neurological disorder; ischaemia-related disorder; stroke; cerebral infarction, ischaemic encephalopathy; neurodegenerative disorder; Alzheimer's disease; Huntington's disease; Parkinson's disease; Infection; meningitis; malaria; trypanosomiasis; vascular disease; opthalmological disorder; disbetic retinopathy;

The peptides may be used for enhancing memory and for treating Alzheimer's disease or dementia. They may also be used for treating apoptosis, necrosis, Parkinson's disease, multiple sclerosis and acute and chronic spinal cord injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human cell death protective cDNA clone CNI-00721 ORF19 peptide,

protective ORFs. The cell death protective cDNA clones are able to prevent, delay or reverse progression through the apoptotic or necrotic CC pathways when injected into a cell predisposed to or undergoing cell CC death. The cell death protective nucleic acids and polypeptides can be used in the diagnosis and treatment of disorders associated with cell CC expression. Such modulators, preferably a small organic molecule, an compounds which modulate their activity or creatibody, a ribozyme, or an antisense molecule can also be used to treat cell death related diseases. Such diseases include those associated with CC the central nervous system including psychiatric or neurological the central nervous system including psychiatric or neurological conditions includes neurodegenerative diseases. The modulators may also be used to treat infections such as meningitis, malaria, or trypanosomiasis; vascular diseases such as ischaemic encephalopathy or cerebral infarction; bypertension; myocardial infarction; atherosclerosis; conditions such as asthma or chronic obstructive pulmonary cell conditions such as asthma or chronic obstructive pulmonary cell conditions such as anemia; gastrointestinal conditions such as cancers or benigh tumours; blood cell conditions such as asthma or chronic obstructive pulmonary cell conditions such as asthma or conditions such as biliary conditions such as glomerulonephritis; cystitis; conditions such as grave's disease or Hashimoto's chystem disorders such as glomerulonephritis; cystitis; conditions such as acquired immunodeficiency syndrome (AIDS). The nucleic acids may additionally be used to generate animal models of cell death protective polypeptide.

Nature of the present sequence represents a cell death protective polypeptide.

The method comprises determining the level of a desired physiological activity in a series of hexapeptides and selecting those with the highest activities. The peptides are then processed using a genetic algorithm computer program which: (i) exchanges one or more amino acid residues between pairs of peptides (crossover) and/or (ii) substitutes amino acid residues in a peptide for different ones (mutation) (preferably with a mutation frequency of about 3% of the total number of residues). The altered peptides are synthesised and the screening cycle is repeated until peptides are synthesised and the screening cycle is repeated until peptides are synthesised and the screening cycle is repeated until a high activity (e.g. as enzyme inhibitors) can be used to produce compositions for use in the drug, foodstuff and other industries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              remaining peptide(s) and cycling through this sequence to obtain peptide(s) with high activity

The present invention describes peptides (I) that bind to calreticulin (CR), specifically comprising the sequence: KGXIX2X3R, where one or more X = basic amino acid (aa). (I) are used to treat cancer (particularly of the prostate or breast, or promyelocytic leukaemia), chronic inflammation (e.g. arthritis) or osteopprosis, also they can be used to treat other bone diseases. (I) act by modulating binding of hormone receptors (HR) to DNA. The present sequence represents a peptide used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides AAW68419-W68434 represent peptides obtained by the cyclic screening method of the invention. The method comprises determining the level of a desired physiological activity in a series of hexapeptides and selecting those with the highest activities. The peptides are then processed using a genetic algorithm computer program which; (1) exchanges one or more amino acid residues between pairs of peptides (crossover) and/or (ii) substitutes amino acid residues in a peptide for different ones (mutation) (preferably with a mutation frequency of about 3% of the total number of residues). The altered peptides with the desired level of activity are generated. Peptides with the desired level of activity are generated. Peptides with a number of residues with the desired level of activity are generated. Peptides with activity (e.g. as enzyme inhibitors) can be used to produce compositions for use in the drug, foodstuff and other industries.
                                                                                                                                                                                                                                                                                                                                                                     New peptides that bind calreticulin and modulate gene expression are activated by hormone receptors, useful in the treatment of cancer, chronic inflammation and osteoporosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Calreticulin; binding; hormone responsiveness; modulation; mimetic; inhibitor; gene therapy; cancer; osteoporosis; pharmaceutical; chronic inflammatory disease; promyelocytic leukaemia; arthritis; bone disease; hormone receptor binding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          •
             protein search, using sw model
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Issued_Patents_AA:*

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score

neuropeptide GNFFRFamide - tapeworm (Moniezia expansa)
C:Species: Moniezia expansa
C:Date: 10-Nov-1997 #sequence_revision 14-Nov-1997 #text_change 14-Nov-1997
C:Accession: A43129
C:Accession: A43129
Biochem. Biophys. Res. Commun. 193, 1054-1060, 1993
A:Title: GNFFRFamide: A novel FMFFamide-immunoreactive peptide isolated from the sheep A:Peference number: A43129; MUID:93312289
A:Accession: A43129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Idminin B1 - western wild mouse (fragment)
C; Species: Mus spretus (western wild mouse)
C; Date: 02-Jul-1996 #sequence_revision 02-Jul-1996 #text_change 05-Nov-1999
C; Accession: I49421
R; KO, M.S.; Wang, X.; Horton, J.H.; Hagen, M.D.; Takahashi, N.; Maezaki, Y.; Nadeau, J. Mamm. Genome 5, 349-355, 1994
A; Title: Genetic mapping of 40 cDNA clones on the mouse genome by PCR.
A; Accession: I49421
A; Accession: I49421
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: DNA
A; Residues: 1-6 <RESS
                                                                                                 밁

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

----inustatin 3.
"Isolation and identification of multiple neuropeptides of the allatostatin superfamily in the shore crab Carcinus maenas.";
Eur. J. Biochem. 250:727-734(1997).

-I- FUNCTION: MAY ACT AS A NEUROTRANSMITTER OR NEUROMODULATOR
- SIMILARITY: BELONGS TO THE ALLATOSTATIN FAMILY.
Neuropeptide; Amidation; Multigene family.
Neuropeptide; Amidation; Multigene family.

AMIDATION (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; Arthropoda; Crustacea; Malacostraca;
